PRINTABLE

CUCM dial-plan cheat sheet

Objects

- Partition: where a pattern lives.
- Calling search space: ordered partitions a caller may see.
- Line CSS then device CSS.
- Route pattern selects a list, trunk, or block.
- Route list: ordered route groups.
- Route group: gateways or trunks.
- Translation: change digits and analyze again.
- Transformation: change digits on egress only.

Match rules

- More specific pattern wins.
- Partition order breaks a tie. Line CSS is first.
- X is one digit. The dot is the PreDot boundary, not a wildcard.
- ! waits on the interdigit timer unless the pattern is urgent.
- 911 must be reachable with no prefix, from every class of service.

Lab pattern

9.55501XX discards 9 and can route 555-0100 through RL-PSTN to a gateway at 192.0.2.40. A called-party transformation may prefix +1. It does not choose the gateway. Local route group lets one pattern egress the device pool's gateway.

Second lookup

A translation pattern uses its own CSS unless Use Originator's Calling Search Space is set. An empty CSS on that second lookup sees only the null partition.

UC Lab field card · fictional examples only · confirm RFCs and current vendor docs before production changes.
